

Task E

Measures and mitigation

A list of list mitigations strategies may be worked out based on existing and upcoming knowledge on ecological impacts of hydropeaking. Combination of measures (operational restrictions, physical habitat enhancements, etc.) will be linked to the modeling tools to estimate mitigation potential and relate this to environmental objective targets (e.g. good ecological potential as defined in WFD) and cost-efficiency. Optimized mitigation strategies will be designed for at least two hydropeaking systems.
